APTOHIRE

Unique Value Proposition & Secret Sauce

Positioning, differentiation, and potential defensibility

PRODUCT THESIS
Make practical capability visible through evidence—not just claims on a resume.

Product: AptoHire | **Website:** aptohire.vercel.app

Document: IDEA-02 | **Version:** 1.0 | **Date:** 30 October 2026

Audience: Hackathon judges, university partners, product team and prospective investors

This document separates founder-provided context, proposed product direction, and claims that require measured validation.

AptoHire

Recommended positioning

One-line value proposition
AptoHire turns student projects into explainable, shareable proof of skill—then connects that evidence to employers and university placement intelligence through privacy-first, consent-based workflows.

Positioning line to test: “Hired for what you can do.” Supporting narrative: “Talent is not scarce. Trusted proof is.” These are proposed brand messages, not validated customer language.

Value by audience

Audience	Potential value	Evidence needed
Students	Portable proof of demonstrated skills, improvement feedback, control over sharing.	Completion, trust, repeat use and employer engagement.
Universities	Structured cohort skill evidence and visibility into employer-demand gaps.	Placement-team usage, data quality, budget owner and workflow fit.
Employers	Inspect evidence-backed skills and discover relevant candidates before requesting identity.	Screening time, shortlist relevance, recruiter trust and willingness to pay.

Differentiation hypothesis

Dimension	Common alternative pattern	AptoHire intended approach
Primary object	Resume, application or one-off test result.	Portable, evidence-linked skill profile.
Evidence	Candidate-entered claims; verification varies.	Project artifacts mapped to a versioned rubric.
Candidate development	Feedback and practice vary by platform.	Guided proof-building and structured feedback.
Discovery	Applications, referrals, filters or employer-specific tests.	Skills-first discovery with consent-based identity reveal.
University visibility	Placement reports or disconnected spreadsheets.	Aggregate skills and readiness-gap insights.

Potential secret sauce

- Evidence-linked assessment history: skill claims mapped to artifacts, rubric criteria, timestamps and review versions.
- Portable candidate-owned proof that can persist beyond one institution or application cycle.
- A feedback loop—where permitted—comparing AI assessments with human review and later outcomes to improve rubrics.
- Trust architecture: anonymized discovery, explicit identity consent, scoped access, auditability and appeals.
- A three-sided workflow connecting student proof-building, employer discovery and university analytics.

Defensibility reality check
A prompt or model is not a durable moat. These are potential advantages, not proven defensibility. A moat must be earned through adoption, trusted evidence, high-quality rubrics, integrations and demonstrated outcomes.

Product principles

- Evidence over claims: scores should point to the artifact and criterion that support them.

- AI may recommend; deterministic authorization and consent controls must govern access.
- Explain uncertainty and missing evidence instead of showing only an opaque score.
- Do not score irrelevant traits such as accent, camera quality or background for technical skill.
- Disclose AI involvement, allow corrections and provide an appeal path.
- Promise improved visibility—not guaranteed jobs, interviews or shortlisting.

Messages to validate

Message	Emphasis	Test
Hired for what you can do.	Candidate capability and opportunity.	Does it resonate without implying a job guarantee?
Proof over resumes.	Evidence and differentiation.	Does it feel credible to recruiters?
One skill record. More opportunity.	Portability and ecosystem.	Can a user explain the product after one exposure?
