APTOHIRE

Feasibility Report

Technical, operational, AI, financial, and trust feasibility

PRODUCT THESIS
Make practical capability visible through evidence—not just claims on a resume.

Product: AptoHire | **Website:** aptohire.vercel.app

Document: IDEA-03 | **Version:** 1.0 | **Date:** 30 October 2026

Audience: Hackathon judges, university partners, product team and prospective investors

This document separates founder-provided context, proposed product direction, and claims that require measured validation.

AptoHire

Executive assessment

Area	Assessment	Condition
Technical	Feasible for a focused prototype	Verify each deployed feature and access path.
AI	Feasible with constraints	Evidence-linked outputs, schema validation and human review.
Operational	Feasible for a small pilot	Start with one skill family and capped submissions.
Financial	Low-cost demo is plausible; commercial cost unknown	Measure inference, storage, hosting and reviewer costs.
Market	Unproven	Validate buyer, budget, adoption and willingness to pay.
Privacy/security	Requires deliberate controls	Employment and education-related data require careful handling.

Technology direction based on founder-provided materials

Layer	Known / described direction	Feasibility note
Frontend	Vite + React + TypeScript (in product materials)	Suitable for a multi-portal web prototype.
Hosting	Vercel (in product materials)	Review commercial plan terms before scale.
Backend/data	Supabase: Postgres, Auth, Storage, Realtime, Edge Functions (in architecture materials)	Test row-level security and tenant isolation.
AI/workflows	Founder confirms OpenRouter, n8n and Google AI Studio are used.	Document actual production call paths and model versions.
Planning/development	Arena, Claude, Gemini and ChatGPT used for planning, research and development.	Do not imply these are all integrated into the deployed product.

Recommended assessment pipeline

- Validate authorization, file types, size limits, consent state and submission completeness.
- Treat submitted repositories, READMEs and documents as untrusted data, not instructions.
- Generate criterion-level feedback with evidence references, uncertainty and missing evidence.
- Validate output schema, score bounds and evidence IDs before showing results.
- Route uncertain or appealed cases to human review.
- Keep identity disclosure and permissions outside the model's authority.
- Log model/rubric versions, latency, estimated cost and reviewer overrides while minimizing raw-data retention.

Key risks and mitigations

Risk	Mitigation
Unsupported AI scores	Require evidence references, schema checks, benchmark testing and human review.
Prompt injection in project files	Treat files as untrusted content; isolate tools; never execute arbitrary submitted code.
Identity leak before consent	Enforce authorization at database/API layer; test access policies and audit identity reveal.
AI provider outage or quota	Rate limits, caching, graceful error states and clearly labelled demo fallback.
Storage/inference cost growth	Cap uploads, make video optional, cache repeat work and measure cost per assessment.
Bias/accessibility risk	Use relevant criteria, offer alternative evidence formats and provide appeals.
Vendor/privacy mismatch	Review provider terms and data handling before sending real or sensitive user data.

Budgetary feasibility

A precise budget cannot be responsibly estimated without expected users, assessment volume, average artifact size, model selection, retention period and support requirements. For a demo, free or low-cost tiers may suffice if their terms permit the use. Commercial operation introduces costs for hosting, database/storage, AI inference, backups, monitoring, security review, legal review and human assessment. Vendor prices and plan limits should be verified when the volume assumptions are known.

Go/no-go gates

Gate	Required evidence
Demo-ready	Critical journey works; secrets stay server-side; mock data is labelled.
Assessment-ready	Versioned rubric, blind human-review sample, error analysis and appeals.
Pilot-ready	Privacy notice, consent, retention rules, incident process and access-control tests.
Commercial-ready	Buyer evidence, paid pilot, cost per assessment, support model and legal/vendor review.

Verdict
GO for a constrained prototype and customer discovery. Not yet GO for claims of validated scoring, commercial readiness, unbiased hiring or proven savings.
