HACKATHON SUBMISSION • AI DISCLOSURE

AI Utilization Report

AptoHire | AI used to build the product—and AI designed to power it

~85%	2	3
Estimated AI-assisted execution activities	AI layers: development and product	Founding team members

Executive summary

AptoHire used AI-assisted workflows across ideation, market and product analysis, technical documentation, prompt engineering, UI/UX iteration and full-stack prototype development. The team retained human ownership of product decisions, review, manual testing and iteration.

Separately, AptoHire's product vision includes AI-assisted project/skill evidence review, skill-based blind matching, profile assistance and a future structured AI-led skill interview. These are described as planned capabilities unless implementation has been verified in the live prototype.

REPORTING NOTE

The ~85% figure is a team-reported qualitative estimate of AI-assisted execution—not an audited measurement of hours, code authorship or AI-generated lines of code.

Prepared for AptoHire hackathon submission • 30 October 2026 • Version 1.1

01 | AI used to build AptoHire

The development workflow combined AI-assisted planning and coding with human review, testing and product decisions.

Team discussion	Gemini · Claude · ChatGPT	PRD, architecture, prompts	Arena AI coding assistance	Human testing and feedback

Tool / area	Reported use	Evidence status
Gemini	Planning, idea exploration, market/product analysis	Planning traces included in evidence ZIP
Claude	Planning, prompt refinement, technical docs and coding prompts	Planning log, prompts and documentation included
ChatGPT	Brainstorming, planning, marketing analysis and technical learning	Team-reported; full conversation export not included
Arena AI	Prompt-led coding assistance for root, student, university, organization and admin portals	Portal traces included; backend trace pending
UI/UX workflow	Explore interface ideas, refine prompts, implement and iterate	Team-reported; assess with live prototype/screenshots
Human testing	Run flows, find gaps, review outputs and feed back fixes	Team-reported; test coverage not quantified

Evidence reviewed: AI_Utilization.zip supplied by the team, including planning traces/logs, portal coding traces, Claude prompts, technical documentation, architecture/PRD materials and API contracts. The backend Arena trace is to be added.

02 | AI designed to power AptoHire

The product AI layer aims to make skill evidence more useful and talent discovery more relevant. The capabilities below are the product vision; label a feature as live only after implementation and validation.

Capability	Intended AI role	Status
Project & skill evidence review	Assist with reviewing project descriptions, submitted evidence and skill claims; flag missing or inconsistent information for review.	Planned / verify live implementation
Skill-based blind matching	Compare role requirements with relevant skill evidence and recommend candidates while minimizing unnecessary identity exposure in initial discovery.	Planned / verify live implementation
AI profile assistance	Help students structure project descriptions, organize skills and identify missing information without inventing experience.	Planned / verify live implementation
AI judge / skill interview	Future structured role-relevant questions, rubric-based feedback and human-reviewed assessment signals.	Future roadmap
University skill insights	Potential cohort-level skill-gap insights using permitted data and privacy safeguards.	Potential future capability

Blind matching: intended flow

1. Role requirements	2. Skill-evidence comparison	3. Relevant candidate shortlist	4. Human review

Blind matching can reduce some identity-driven signals but does not guarantee bias-free outcomes. Criteria, data quality, privacy, explainability and human review must be tested.

03 | UI/UX and user experience

AI helped the team explore interface ideas, plan layouts, refine prompts and accelerate implementation. Human review and manual testing remained part of the loop.

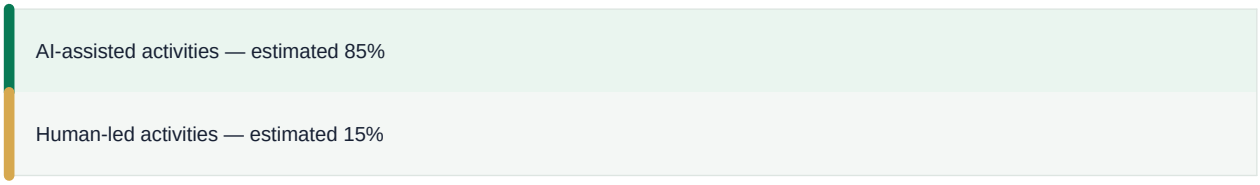
DISCOVER	PLAN	IMPLEMENT	REVIEW	REFINE
User needs & team discussion	AI-assisted UI ideas	Prompt-led implementation	Visual and manual testing	Feedback and iteration

What to demonstrate to judges

- A consistent experience across student, university and organization portals.
- Clear navigation and role-specific workflows.
- Real interactions where supported by the prototype; clearly label mock data and unfinished flows.
- A short student evidence/profile example and an organization discovery example, if those flows currently work.

04 | AI utilization estimate

Approximately 85% AI-assisted execution — qualitative team estimate. The estimate reflects AI support across planning, market/product analysis, documentation, technical learning, prompt engineering, UI/UX iteration and coding assistance. Human contribution remained essential for product decisions, requirements, review, manual testing, identifying Version A's shortcomings and choosing Version B.



Important: The supplied materials do not provide a complete time log, task-by-task attribution, code authorship analysis or an independently audited AI/human split. Do not describe this as “85% of code was written by AI.” Align the estimate with the hackathon's formal definition before submission.

05 | Pitch deck & demo video: next AI-assisted phase

The deck and video have not been counted as completed AI usage. The workflow below is a plan; update the report after the assets are actually produced.

VERIFY	STORY	CREATE	DEMONSTRATE	CHECK
Confirm current flows	AI-assisted narrative and slide outline	Build deck and demo script	Record a real walkthrough	Human fact-check and final review

Potential tools: Arena, Manus, Claude, ChatGPT, Gemini, NotebookLM and Google AI Studio. Use only the tools that materially help, and record the ones actually used.

06 | Responsible AI principles

Evidence, not fabrication: Profile assistance must not invent skills, projects or experience.

Human oversight: AI recommendations and future interview feedback should support—not replace—human judgment.

Privacy by design: Limit information shared, respect student permissions and protect project evidence.

Fairness testing: Blind matching does not eliminate all bias; evaluate criteria, data quality and outcomes.

Honest product status: Separate implemented features from planned AI capabilities and production readiness.

Disclosure: Follow the hackathon's AI-use policy and disclosure requirements.

Submission-ready summary

AptoHire used AI-assisted workflows for ideation, planning, market and product analysis, technical documentation, prompt engineering, UI/UX iteration and full-stack prototype development. Gemini, Claude, ChatGPT and Arena AI supported different parts of the workflow, while the team retained responsibility for product decisions, review, manual testing and iteration. Based on the workflow and supporting artifacts, the team estimates that approximately 85% of execution activities were AI-assisted; this is a qualitative estimate, not an audited measurement. Within the product vision, AI is intended to support project/skill evidence review, skill-based blind matching and profile assistance, with structured AI-led skill interviews on the future roadmap. Product features will be described as live only after implementation and validation. AI-assisted pitch-deck and demo-video work will be documented once completed.
